## Office Action Summary

Application No.	08/845526	Applicant(s)	CHRISTIAN PAPPAS HENRY MORTON ROBERT WILLIAMSON
Examiner	Mario PADMANABHAN	Group Art Unit	2772

Responsive to communication(s) filed on 4/25/97.

This action is FINAL.

Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11; 453 O.G. 213.

A shortened statutory period for response to this action is set to expire \_\_\_\_\_ month(s), or thirty days, whichever is longer, from the mailing date of this communication. Failure to respond within the period for response will cause the application to become abandoned. (35 U.S.C. § 133). Extensions of time may be obtained under the provisions of 37 CFR 1.136(a).

### Disposition of Claims

Claim(s) 1-25 is/are pending in the application.

Of the above, claim(s) \_\_\_\_\_ is/are withdrawn from consideration.

Claim(s) \_\_\_\_\_ is/are allowed.

Claim(s) 1-25 is/are rejected.

Claim(s) 8 is/are objected to.

Claims \_\_\_\_\_ are subject to restriction or election requirement.

### Application Papers

See the attached Notice of Draftsperson's Patent Drawing Review, PTO-948.

The drawing(s) filed on \_\_\_\_\_ is/are objected to by the Examiner.

The proposed drawing correction, filed on \_\_\_\_\_ is  approved  disapproved.

The specification is objected to by the Examiner.

The oath or declaration is objected to by the Examiner.

### Priority under 35 U.S.C. § 119

Acknowledgement is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d).

All  Some\*  None of the CERTIFIED copies of the priority documents have been

received.

received in Application No. (Series Code/Serial Number) \_\_\_\_\_.

received in this national stage application from the International Bureau (PCT Rule 17.2(a)).

\*Certified copies not received: \_\_\_\_\_.

Acknowledgement is made of a claim for domestic priority under 35 U.S.C. § 119(e).

### Attachment(s)

Notice of References Cited, PTO-892

Information Disclosure Statement(s), PTO-1449, Paper No(s). \_\_\_\_\_

Interview Summary, PTO-413

Notice of Draftsperson's Patent Drawing Review, PTO-948

Notice of Informal Patent Application, PTO-152

--- SEE OFFICE ACTION ON THE FOLLOWING PAGES ---

Art Unit: 2772

## **DETAILED ACTION**

### ***Claim Objections***

Claim 8 is objected to because of the following informalities: the line “rendering the curve or surface with the graphics rendering pipeline” appears in 2 consecutive lines of this claim, and seems to be a typographical error . Appropriate correction is required.

### ***Claim Rejections - 35 USC § 102***

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless --

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claim 16 is rejected under 35 U.S.C. 102(b) as being clearly anticipated by Luken, Jr. (U.S. Patent Number 5,278,948).

Claim 16 lays claim to a method of generating normal vectors for a surface based on generating surface partials, then generating surface tangents from these partials, and generating normals from these tangents.

Art Unit: 2772

Luken teaches a method of generating surface partials, generating tangents, and surface normals (Col.9: lines 6-24).

***Claim Rejections - 35 USC § 103***

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-3, 6, 8 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Jia et al.* (U.S. Patent Number 5,726,896) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684).

Claim 1 lays claim to a computer system that implements the method of receiving a NURBS model from a server, converting it to a Bezier model, generate a plurality of control points on the Bezier curve, and rendering the curve using the graphics pipeline.

*Jia et al* teach a method of converting a NURBS surface model to a Bezier surface model (Col. 4: lines 38-45), and interpolates a plurality of control points (Col. 5: lines 1-5). *Jia et al* fail to teach a method to receive the data from the server (host processor) and rendering it.

*Gharachorloo et al* teach a method to receive data from a host processor into a graphics pipeline, and use the graphics pipeline to render the object ( refer Figs. 1, 2, 2A). Hence it would be

Art Unit: 2772

obvious to one skilled in the art at the time the invention was made to store the surface model data in a host processor, and use this method to download the data as needed, and use the method taught by *Jia et al* to display the object, as this would ensure better utilization of system processing resources on the client machine.

Claim 2 adds to claim 1 the step of receiving the NURBS surface model via the bus.

*Gharachorloo et al* teach a method to receive data using a bus (refer Fig. 1). Hence it would be obvious to one skilled in the art at the time the invention was made to use a bus to receive the NURBS model from a host processor, as it is an effective and dependable communication medium.

Claim 3 adds to claim 1 the step of generating multiple Bezier control points from corresponding NURBS control points.

*Jia et al* teach a method of converting from the general NURBS representation of a curve to a Bezier representation of the same order. This teaches by implication that the two models have the same number of control points.

Claim 6 adds to claim 1 the limitation of generating points on the curve using Bezier control points.

Art Unit: 2772

Jia et al disclose the use of Bezier control points as input to the processor that determines points on the curve (Col.3: lines 32-44).

Claim 8 adds to claim 1 the use of graphics rendering pipeline to render the curve or surface.

Claim 8 is assumed to read “The method of claim 1 further including the steps of: processing the plurality of points with the graphics rendering pipeline; and rendering the curve or surface with the graphics rendering pipeline”. Gharachorloo teaches the use of a Graphics pipeline (Fig. 1). Hence it would be obvious to one skilled in the art at the time the invention was made to use a graphics pipeline to render the curve as this would streamline the process, and accelerate the process of rendering the curve.

Claims 4-5 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Jia et al.* (U.S. Patent Number 5,726,896) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684) as applied to claim 3, and further in view of Schulmeiss (U.S. Patent Number 5,717,847) and Luken, Jr. (U.S. Patent Number 5,278,948).

Claim 4 adds to claim 3 the use of tri-linear interpolator to generate the Bezier control points.

Claim 5 adds to claim 4 the limitation of the use of NURBS control points as input to the tri-linear interpolator, and evaluating these points to generate Bezier control points.

Art Unit: 2772

Jia teaches the method of evaluating a plurality of NURBS control points into Bezier control points (Col.4: lines 38-44). Jia fails to teach the use of tri-linear interpolator, and the input of NURBS control points to the tri-linear interpolator. Luken inherently teaches the use of tri-linear interpolators by disclosing that the de Casteljau process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45), the NURBS control points forming the input to these interpolators. Schulmeiss discloses the use of de Casteljau algorithm to calculate Bezier control points (Col. 2: lines 16-22). Hence it is obvious to one skilled in the art at the time the invention was made to use a tri-linear interpolator to generate the Bezier control points since this will provide high speed and accuracy.

Claim 7 is rejected under 35 U.S.C. 103(a) as being unpatentable over *Jia et al.* (U.S. Patent Number 5,726,896) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684) as applied to claim 6, and further in view of Luken, Jr. (U.S. Patent Number 5,278,948) and Sherman et al (U.S. Patent Number 5,734,756).

Claim 7 adds to claim 6 the limitation that the Bezier control points are input to a tri-linear interpolator to generate points on the curve.

Jia et al disclose the use of Bezier control points as input to the processor that determines points on the curve (Col.3: lines 32-44). Jia et al also teach that the Bezier curve is a special case of the B-spline curve (Col.7: line 27). Jia et al fail to disclose the use of tri-linear interpolator. Luken inherently teaches the use of tri-linear interpolators by disclosing that the de Casteljau

Art Unit: 2772

process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45), the NURBS control points forming the input to these interpolators. Sherman et al teach that Bezier curves are generally evaluated using a recursive algorithm due to de Casteljau (Col.14: lines 32-35). Since Bezier curve is a special case of a NURBS curve, it would be obvious to one skilled in the art at the time the invention was made to input the Bezier control points to a tri-linear interpolator to generate points on the curve, as this would improve system performance.

Claims 9-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Luken, Jr.* (U.S. Patent Number 5,278,948), *in view of Jia et al.* (U.S. Patent Number 5,726,896) and *Sherman et al* (U.S. Patent Number 5,734,756).

Claim 9 lays claim to a method of rendering curves by evaluating a Bezier curve using de Casteljau process in the graphics rendering pipeline.

Luken teaches the use of Cox-DeBoor (or DeCasteljau) process for evaluating a b-spline curve (Col.15: lines 40-44). Luken also teaches the method of using a graphics pipeline (Col.28: lines 59-61), and the use of Cox-DeBoor process in the graphics processor for evaluation (Col.29: lines 5-10). Luken fails to teach the use of these methods for a Bezier curve. Jia et al also teach that the Bezier curve is a special case of the B-spline curve (Col.7: line 27). Sherman discloses that the de Casteljau process is a widely accepted method of evaluating Bezier curves

Art Unit: 2772

(Col. 14: lines 32-35). Hence it would be obvious to one skilled in the art at the time the invention was made to use the de Casteljau process in the graphics pipeline to evaluate a Bezier curve to render the curve, as this method was well tested and widely known in the art.

Claim 10 adds to claim 9 the limitation that the de Casteljau process is implemented using a tri-linear interpolator.

Luken inherently teaches the use of tri-linear interpolators by disclosing that the de Casteljau process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45), the NURBS control points forming the input to these interpolators.

Claim 11 adds to claim 9 the limitation that the Bezier control points are input to a tri-linear interpolator to generate points on the curve.

Luken inherently teaches the use of tri-linear interpolators by disclosing that the de Casteljau process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45), the NURBS control points forming the input to these interpolators. Luken fails to disclose the use of Bezier control points as input to these interpolator. Jia discloses the use of Bezier control points as input to the processor that determines points on the curve (Col.3: lines 32-44). Jia also teaches that the Bezier curve is a special case of the B-spline curve (Col.7: line 27). Sherman et al teach that Bezier curves are

Art Unit: 2772

generally evaluated using a recursive algorithm due to de Casteljau (Col.14: lines 32-35). Since Bezier curve is a special case of a NURBS curve, it would be obvious to one skilled in the art at the time the invention was made to input the Bezier control points to a tri-linear interpolator to generate points on the curve, as this would improve system performance.

Claim 12 adds to claim 11 the limitation of using the plurality of points to render the Bezier curve.

Luken discloses a method of using the points derived by evaluating a b-spline to render a surface (Col.27: lines 11-21). Since Bezier is a special case of a B-spline curve (Jia: Col. 7: line 27), it would be obvious to one skilled in the art at the time the invention was made to use of Bezier control points during evaluation to render a Bezier curve, as this would involve the least amount of operations on the part of the graphics processor.

Claim 13 is rejected under 35 U.S.C. 103(a) as being unpatentable over *Jia et al.* (U.S. Patent Number 5,726,896) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684).

Claim 13 lays claim to a graphics rendering pipeline of a computer system that evaluates the NURBS control points to a Bezier model, generate a plurality of control points on the Bezier curve, and rendering the curve.

*Jia et al* teach a method of loading a processor with the NURBS control points (Col.3: lines 32-36), converting the NURBS surface model to a Bezier surface model (Col. 4: lines 38-

Art Unit: 2772

48), and determining a plurality of points on the Bezier curve. *Jia et al* fail to teach a method of rendering the curve using a graphics pipeline. *Gharachorloo et al* teach a method of using the graphics pipeline to render NURBS surfaces (Col.9: lines 64-67). Hence it would be obvious to one skilled in the art at the time the invention was made to use a graphics pipeline to render the Bezier curve using the points derived by using the method as described by Jia, as this would streamline the rendering process, and ensure better utilization of system processing resources.

Claims 14-15 are rejected under 35 U.S.C. 103(a) as being unpatentable over *Jia et al.* (U.S. Patent Number 5,726,896) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684) as applied to claim 13, and further in view of Schulmeiss (U.S. Patent Number 5,717,847) and Luken, Jr. (U.S. Patent Number 5,278,948).

Claim 14 adds to claim 13 the limitation of using a tri-linear interpolator to evaluate the NURBS control points into Bezier control points.

*Jia* teaches the method of evaluating a plurality of NURBS control points into Bezier control points. *Jia* fails to teach the use of tri-linear interpolator, and the input of NURBS control points to the tri-linear interpolator. *Schulmeiss* discloses the use of de Casteljau algorithm to calculate Bezier control points (Col. 2: lines 16-22). *Luken* inherently teaches the use of tri-linear interpolators by disclosing that the de Casteljau process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45), the NURBS control points forming the input to these interpolators. Hence it is obvious to one

Art Unit: 2772

skilled in the art at the time the invention was made to use a tri-linear interpolator to generate the Bezier control points since this will provide high speed and accuracy.

Claim 15 adds to claim 13 the step of transforming the NURBS curve or surface from a global domain to a local domain.

Gharachorloo teaches a method of transforming the NURBS surface model from a global memory to local memory (Col.2: line 58 - Col.3: line 10 & Col.14: lines 17-27). Hence it is obvious to one skilled in the art at the time the invention was made to use global to local transformation of the NURBS curve, as such a transformation can make better utilization of the available resources.

Claims 17-19 are rejected under 35 U.S.C. 103(a) as being unpatentable over Luken, Jr. (U.S. Patent Number 5,278,948) as applied to claim 16, in view of *Jia et al.* (U.S. Patent Number 5,726,896) and Schulmeiss (U.S. Patent Number 5,717,847).

Claim 17 adds to claim 16 the limitation of using a tri-linear interpolator to evaluate the Bezier control points, and generate surface partials.

Luken inherently teaches the use of tri-linear interpolators by disclosing that the de Casteljau process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45), the NURBS control points forming the input to these interpolators. Luken also teaches the use of interpolators for each component to derive the

Art Unit: 2772

surface partials (Col. 19: lines 18-25). Luken fails to teach the use of Bezier control points as input to the tri-linear interpolator. Jia teaches the method of evaluating Bezier control points (line 35-40). Jia also teaches that Bezier curve is a special case of a B-spline curve. Schulmeiss discloses the use of de Casteljau algorithm to calculate Bezier control points (Col. 2: lines 16-22). Hence it is obvious to one skilled in the art at the time the invention was made to use Bezier control points as input to a tri-linear interpolator to generate surface partials, since Bezier points are a subset of NURBS control points.

Claim 18 adds to claim 16 the step of generating the surface tangents from the surface partials using a blender in the graphics pipeline.

Luken teaches the generation of surface tangents from surface partials for NURBS surfaces (Col.9: lines 6-25). Luken fails to teach this for blending curves. Jia teaches that the Bezier curves are a special case of B-splines, and also teaches the use of Bezier curves as blending functions (Col. 7: lines 29-31). Hence it is obvious to one skilled in the art at the time the invention was made to use such blending curves, since the shape approximation with NURBS is not generally understood, and the NURBS can be exactly represented by a series of piecewise Bezier curves.

Claim 19 adds to claim 18 the step of generating at least one normal from the surface tangents.

Art Unit: 2772

Luken teaches the method of generating normals from surface tangents ( (Col.9: lines 6-25).

Claims 20-24 are rejected under 35 U.S.C. 103(a) as being unpatentable over Luken, Jr. (U.S. Patent Number 5,728,948) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684).

Claim 20 lays claim to a method of rendering a curve by doing a global to local transformation, evaluating the NURBS control points, and rendering the curve using the points thus created.

Luken teaches a method of evaluating NURBS control points to derive points on the curve (Col.15: lines 40-45). Luken fails to teach a transformation from global domain to local domain. Gharachorloo teaches a method of transforming the NURBS surface model from a global memory to local memory (Col.2: line 58 - Col.3: line 10 & Col.14: lines 17-27), rendering a NURBS curve. Hence it would be obvious to one skilled in the art at the time the invention was made to use the transformation as taught by Gharachorloo so as to make better utilization of the local resources.

Claim 21 adds to claim 20 the step of indexing at least one look up table for performing the transformation.

Art Unit: 2772

Luken teaches the use of transformation matrix pre-loaded in memory in the graphics control processor (Col.12: lines 18-20).

Claim 22 adds to claim 21 the limitation of evaluating the NURBS control points using tri-linear interpolator.

Luken inherently teaches the use of tri-linear interpolators for evaluating the NURBS control points, by disclosing that the de Casteljau process performs a linear interpolation between the components (x,y,z) of the control points (Col.4: lines 40-54; Col. 15: lines 32-45).

Claim 23 adds to claim 22 the limitation of indexing the look up table to be able to configure the tri-linear interpolator.

Luken teaches the use of transformation matrix pre-loaded in memory in the graphics control processor (Col.12: lines 15-20), which is used to transform the x, y, z coordinates of the control points.

Claim 24 adds to claim 23 the step of implementing a quadri-linear interpolator using tri-linear interpolator, and generating control points.

Luken discloses the existence of NURBS control points with coordinates (wx,wy,wz,w), and the evaluation of such control points by interpolation (Col.15: lines 32-46). This inherently teaches quadri-linear interpolation.

Art Unit: 2772

Claim 25 is rejected under 35 U.S.C. 103(a) as being unpatentable over Luken, Jr. (U.S. Patent Number 5,728,948) in view of *Gharachorloo et al* (U.S. Patent Number 5,488,684), and further in view of Oha (U.S. Patent Number 5,202,670).

Claim 25 adds to claim 20 the use of convolution in the graphics pipeline to obtain points on the curve.

Oha teaches the convolution of original data and interpolated function in the graphics pipeline to derive a set of points on the curve (Col.15: lines 5-13). Hence it is obvious to one skilled in the art at the time the invention was made to use convolution in order to achieve faster processing of the control points.

### ***Conclusion***

**Any response to this correspondence should be mailed to:**

**Box AF**

Commissioner of Patents and Trademarks
